/note="Organ: Roots; Vector: pBluescript II SK (+) XR;
/site_1: EcoRI (5' end of cDNA); Site_2: XhoI (3' end of cDNA); mRNA was isolated from each tissue source independently and equal quantities of mRNA from each tissue were then pooled. cDNA was prepared from 5 micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA Library Construction Kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for propagation. Normalization was applied according to published methods [Bonaldo M.F. et al. (1996) Genome Research 6 (9):791] in order to reduce the abundance of highly expressed transcripts."

/clone lib-mrg COUG Tachyzoite dDN Keliang Tang, and Robert COLA library was constructed by Keliang Tang, and Robert COLA using the template-switching PCR method (Creator CDNA using the template-switching PCR method (Creator SMART cDNA, Clontech Inc.). First strand was PCR amplified using the same primer set and the fragments were digested with Sfil. The fragments were size selected, ligated into vector pDNR LIB containing directional Sfil sites, and electroporated into GC10 competent cells. WARNING: the library contains a small percentage of cDNAs derived from the human host cells."

/note="Vector: pCMV SPORT6.1; Site 1: EcoR1; Site 2: Not1;

F2, F3, and F4 lines of Aquilegia Formosa X A. pubescens were grown from seed in greenhouses at UC Santa Barbara.

From these plants three sets of tissue were collected: 1)

Small flower buds (<10 mm) and very young inflorescences (71 & 29% by weight respectively), 2) Medium (7-20 mm) and large (at or near anthesis) flower buds (65 & 35% by weight respectively) and 3) Shoot apical meristens. A fourth set of tissue was collected from plants of A. formosa. These plants were grown from seed in sand and at approximately 1 month root tissue and leaf tissue of various developmental stages were collected (84 & 16% by weight respectively). Total RNA was extracted from each set of tissue and pooled in the following proportions:

1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled total RNA, mank, was extracted and enriched for full-length messages and then normalized with proprietary methods by Invitrogen."

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being prime.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq length: 0 seq length: 2000000000

; Sequence 1072, Application US/09270767
; Patent No. 6703491
; GENERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094
; CURRENT APPLICATION NUMBER: US/09/270,767
; CURRENT FILING DATE: 1999-03-17
; NUMBER OF SEQ ID NOS: 62517
; SOFTWARE: PatentIn Ver. 2.0
; SEQ ID NO 1072
; LENGTH: 1345
; TYPE: DNA
; ORGANISM: Drosophila melanogaster

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
